

We build the technology that runs your business.

Most businesses do not need five separate vendors. They need one team that understands the whole picture — design, development and growth under a single roof. That is what we do.

10+

services under one roof

2

products of our own

100%

built in-house

Tiruppur

based, working anywhere

01 Who we are

HephoraTech is a small in-house team building websites, mobile apps, e-commerce stores and SaaS platforms. The people who scope your project are the same people who build and support it — there is no account manager between you and the work. We also build and run our own software products on the same stack we use for client work, so nothing reaches you that we have not run ourselves.

02 What we do

Web & App Development

Websites, web applications and mobile apps for Android and iOS, built for speed and conversion.

Websites · Web Apps · iOS & Android · Dashboards

E-Commerce

Shopify stores, Amazon storefronts and multi-platform commerce built around turning visits into orders.

Shopify · Amazon · WooCommerce · Payments

SEO & Optimization

Technical SEO, page speed and on-page work, so people find you and the page actually loads fast.

Technical SEO · Core Web Vitals · Audits

Automation & AI

Workflow automation and AI assistants embedded into your site, product or internal operations.

Workflows · AI Chat · Integrations · Documents

Social Media & Ads

Content calendars, post design and Meta campaigns built around enquiries, not vanity metrics.

Instagram · Facebook · Meta Ads · Creative

SaaS Product Builds

Architecture, multi-tenancy, billing and cloud deployment for teams shipping their own platform.

Architecture · Multi-tenancy · Billing · Cloud

03 What each service actually includes

Scope is agreed in writing before anything is built. The list below is what a typical engagement covers — yours is quoted to what you actually need, not a fixed package.

Web & App Development

Marketing sites, web applications, admin dashboards, booking systems, and native Android and iOS apps from one codebase.

- Design and build from wireframe to deploy
- Responsive across phone, tablet and desktop
- Admin panels so you can update content yourself
- Play Store and App Store submission handled

E-Commerce

Storefronts that are set up to sell, on the platform that fits how you actually operate.

- Shopify, WooCommerce or Amazon storefronts
- Payment gateway and delivery integration
- Product catalogue and inventory setup
- Checkout and product-page optimisation

SEO & Website Optimization

Technical work on sites that already exist, plus the on-page structure search engines rely on.

- Technical audit with a written action list
- Core Web Vitals and page-speed work
- On-page structure, titles and schema
- Local SEO and Google Business Profile

Automation & AI

Removing the repetitive work your team should not be doing by hand.

- Workflow and CRM automation
- AI chat and search widgets on your site
- Document and form processing
- Integration between tools you already use

Social Media & Ads

Content and paid campaigns run as an ongoing retainer, reported in plain language.

- Content calendar and post design
- Instagram and Facebook management
- Meta ad campaigns and creative testing
- Monthly reporting you can actually read

SaaS Product Builds

For teams shipping their own platform, not just a website.

- Architecture and multi-tenant data design
- Subscription billing and payment flows
- Cloud deployment, monitoring and backups
- Ongoing development after launch

04 Why clients choose HephoraTech

● One team from start to finish

Design, development and growth sit in the same room. Nothing is subcontracted out, so there are no handoffs where scope gets lost and no vendors blaming each other when something breaks.

● You talk to the people building it

There is no account manager relaying messages. The person who scoped your project is the person writing the code, so answers come back the same day and in plain language.

● We run our own products on the same stack

We do not only implement other people's software. We build and operate our own platforms, which means the tools we recommend are ones we already depend on ourselves.

● We stay on after launch

Launch is a milestone, not a handoff. Defects in our own work are corrected free within the support window written into your proposal.

05 What you gain

You own what we build

On full payment, ownership of the custom work — source code and design files — transfers to you. You are not locked into us to keep it running.

One vendor instead of five

No duplicated work, no budget lost in translation between agencies, and one invoice.

Scope and price agreed in writing

You approve a written scope and quotation before work starts. Anything outside it is quoted separately, so the number does not move under you.

Built to grow with you

Architecture chosen so the site or platform you launch does not need rebuilding when demand rises.

Support that continues

We monitor, fix and improve after go-live rather than disappearing at handover.

Honest scoping

If something is not worth building, we say so before you pay for it.

06 How a project runs

01

Scope

We work out what you need, and what it costs. Quotation in writing.

02

Design

Screens and structure agreed before any code is written.

03

Build

Built and tested in the open, with progress you can see.

04

Launch

We deploy it, hand over access, and stay on afterwards.

07 Software we have built

Beyond client work we build our own products. Both were designed, built and shipped end to end by this team.

LIVE ON GOOGLE PLAY

Custom Food Delivery App

A complete ordering and delivery platform built for a food business and published to the Google Play Store — customer app, admin dashboard and kitchen operations in one system. We handled the build, the Firebase backend and the full Play Store submission, start to finish.

- Branded customer ordering app
- Order tracking and cash on delivery
- Phone OTP and Google sign-in
- Live menu and category management
- Admin dashboard, web and in-app
- Push notifications and customer chat

EARLY ACCESS

SmartUp — School Management Platform

One system replacing the paper registers, WhatsApp groups and spreadsheets most schools run on. Built multi-tenant from day one, so a school can be onboarded without new code or a separate app. Currently in active development and open to early-access schools.

- Admin, teacher and parent roles
- Marks, grading and report cards
- Timetable, homework and announcements
- Attendance and digital registers
- Fees, installments and online payments
- Teacher and parent messaging

Tell us what you are trying to solve.

Free consultation. No-obligation quotation.

We reply within one working day.
